

## Sound II.

Interference of sound waves  
 Standing waves  
 Complex sound waves

## Interference of sound waves

Two sound waves superimposed

Constructive Interference

Destructive Interference

## Noise canceling headphones

## Interference due to path difference

Superposition of waves at A shows interference due to path differences

Condition for **constructive** interference  $\delta = m\lambda$   
 Condition for **destructive** interference  $\delta = (m + \frac{1}{2})\lambda$   
 where m is any integer  $m = 0 \pm 1, \pm 2, \dots$

## Interference

## Interference

## Interference

$\delta = \lambda$  Constructive Interference

## Interference of sound waves

Phase shift due to path differences

When  $r_2 - r_1 = m\lambda$  **Constructive Interference**

When  $r_2 - r_1 = (m + \frac{1}{2})\lambda$  **Destructive Interference**

$m$  is any integer

## Example

An experiment is performed to measure the speed of sound using by separating the sound from a single source along two separate paths with different path lengths and combining them at the detector. For a frequency of 3.0 kHz (assume  $v_{\text{sound}} = 340 \text{ m/s}$ );

A) What would the smallest path difference be to observe a minimum in intensity

$$r_2 - r_1 = \frac{\lambda}{2} = \frac{v}{2f} = \frac{340 \text{ m/s}}{2(3 \times 10^3 \text{ s}^{-1})} = 5.7 \times 10^{-2} \text{ m} = 5.7 \text{ cm}$$

B) What would the smallest (non-zero) path difference be to observe a maximum in intensity.

$$r_2 - r_1 = \lambda = 11 \text{ cm}$$

Example 14.6 Path difference for two sources.

At position P the listener hears the first minimum in sound intensity. Find the frequency of the oscillation.  
 $v_{\text{sound}} = 340 \text{ m/s}$

At position P the path difference is equal to  $\lambda/2$ . (first minimum) destructive interference.

$$\frac{\lambda}{2} = r_2 - r_1 = 0.13 \text{ m}$$

$$\lambda = 2(0.13) = 0.26 \text{ m}$$

$$f = \frac{v}{\lambda} = \frac{340 \text{ m/s}}{0.26 \text{ m}} = 1.31 \times 10^3 \text{ Hz}$$

## Standing Waves

Standing waves (waves on a string)

Standing waves in air columns.

## Standing Wave

- A standing wave is formed by reflections back and forth at the boundaries of a media.
- The standing wave does not carry energy but serves to store energy.
- The standing wave stores energy of waves with specific wavelengths.

### Standing Waves

- A standing wave is generated by superposition of two waves with the same frequency and wavelength traveling in opposite directions.

Simulation of a standing wave.

<http://www.walter-fendt.de/ph14e/stwaverefl.htm>

### Standing Wave Conditions

One node at each end with additional nodes only at specific positions

Distance between nodes =  $\lambda/2$

A string with length L can support standing waves of only at certain wavelengths.

$$L = \frac{\lambda}{2} n$$

where n=1, 2, 3... integer values  
n=1 called the fundamental  
n=2 called the second harmonic etc.

### Standing wave frequencies and wavelengths

n=1  $f_1 = \frac{v}{2L}$

n=2  $f_2 = \frac{v}{L} = 2f_1$

n=3  $f_3 = \frac{3v}{2L} = 3f_1$

Generally

$$f_n = \frac{v}{\lambda} = \frac{v}{2L} n = nf_1$$

where n = 1, 2, 3.....

### Example

Find the fundamental and second harmonics of a steel wire 1.0m long fixed at both ends. The speed of the wave in the string is  $v=200$  m/s

$\lambda_1 = 2L$      $f_1 = \frac{v}{2L} = \frac{200}{2(1)} = 100\text{Hz}$

$\lambda_2 = L$      $f_2 = \frac{v}{L} = 2f_1 = 200\text{ Hz}$

### Standing waves in air columns Fundamental Frequency

<p>2 ends closed</p> <p><math>L = \frac{\lambda_1}{2}</math></p> <p><math>\lambda_1 = 2L</math></p> <p><math>F_1 = \frac{v}{2L}</math></p>	<p>2 ends open</p> <p><math>L = \frac{\lambda_1}{2}</math></p> <p><math>\lambda_1 = 2L</math></p> <p><math>F_1 = \frac{v}{2L}</math></p>	<p>one end open one end closed</p> <p><math>L = \frac{\lambda_1}{4}</math></p> <p><math>\lambda_1 = 4L</math></p> <p><math>F_1 = \frac{v}{4L}</math></p>
--	--	--

v is the speed of sound in air F<sub>1</sub> lower by a factor of 2

### Cylinder open at both ends Harmonics

$\lambda_1 = 2L$	$f_1 = \frac{v}{\lambda_1} = \frac{v}{2L}$	First harmonic
$\lambda_2 = L$	$f_2 = \frac{v}{L} = 2f_1$	Second harmonic
$\lambda_3 = \frac{2}{3}L$	$f_3 = \frac{3v}{2L} = 3f_1$	Third harmonic

(a) Open at both ends

$f_n = n f_1 \quad n = 1, 2, 3, 4 \dots \dots \text{All harmonics}$

### Cylinder open at one end closed at one end - Harmonics

$\lambda_1 = 4L$	$f_1 = \frac{v}{\lambda_1} = \frac{v}{4L}$	First harmonic
$\lambda_3 = \frac{4}{3}L$	$f_3 = \frac{3v}{4L} = 3f_1$	Third harmonic
$\lambda_5 = \frac{4}{5}L$	$f_5 = \frac{5v}{4L} = 5f_1$	Fifth harmonic

(b) Closed at one end, open at the other

$f_n = n f_1 \quad n = 1, 3, 5, 7 \dots \dots \text{Only odd harmonics}$

### Summary For a cylinder with the same length

<p>Frequency</p> <p>5f<sub>1</sub></p> <p>4f<sub>1</sub></p> <p>3f<sub>1</sub></p> <p>2f<sub>1</sub></p> <p>f<sub>1</sub></p> <p>0</p>	<p><math>f_n = \frac{v}{2L} n</math></p> <p><math>f_n = f_1 n</math></p> <p><math>n = 1, 2, 3 \dots</math></p> <p>all harmonics</p>	<p>7f<sub>1</sub></p> <p>5f<sub>1</sub></p> <p>3f<sub>1</sub></p> <p>f<sub>1</sub></p> <p>0</p>	<p><math>f_n = \frac{v}{4L} n = f_1 n</math></p> <p><math>n = 1, 3, 5 \dots \dots</math></p> <p>only odd harmonics</p>
--	---	---	--

both ends open/ closed
one open one closed

### Example

A cylinder 5.0 cm in length is closed at one end and open at the other. Find the frequency of the third harmonic of the standing wave in the column.  $v_{\text{air}} = 340 \text{ m/s}$

$\lambda_1 = 4L \quad f_1 = \frac{v}{\lambda_1} = \frac{v}{4L}$

$\lambda_3 = \frac{4L}{3} \quad f_3 = 3f_1 = \frac{3v}{4L} = \frac{3(340)\text{m/s}}{4(0.05)\text{m}} = 5.1 \times 10^3 \text{ Hz}$

### Musical Instruments

#### String Instruments

Frequency due to standing waves on the string.  
The body of the instrument acts as a resonator to move air to amplify the sound.

## Musical Instruments

### Wind instruments

The sound is produced by vibrating element (reed, vocal chord) and certain specific frequencies are enhanced by resonance in the air column

## Complex waves

- In general sound waves are a combination of different frequencies.
- The superposition of waves with different frequencies gives rise to the characteristic quality (timbre) of the sound.
- The different frequencies can be determined by mathematical procedure called a Fourier Transform.

Complex waves consist of different frequency components, i.e. harmonics.

displacement

relative amplitude
