

**Problem 1** (10 pts)

A body of mass 2.8g floats on water (density of water =  $1\text{g/cm}^3$ ) with 70% of its volume submerged. In another liquid, this body sinks to the bottom and has weight corresponding to an apparent mass of 2.0g. Find:

- (a) The volume of the body, in  $\text{cm}^3$ .
- (b) The density of the other liquid, in  $\text{g/cm}^3$ .

**Problem 2** (10 pts)

There is water flowing through the pipe shown above, from left to right. The radius on the left side is  $r_1$ , on the right side  $r_2$ , with  $r_2 < r_1$ . The pressure difference between both sides is  $\Delta P = 6\text{kPa}$ .

- (a) Which side has higher pressure, right or left? Justify.
- (b) Find an expression for the speed of water flow on the right side,  $v_2$ , in terms of the pressure difference  $\Delta P$ , the water density  $\rho$  and the radii of both sides  $r_1, r_2$ .
- (c) With  $r_1 = 5\text{cm}$ ,  $r_2 = 3\text{cm}$  and the density of water  $1000\text{kg/m}^3$ , find the speed of water flow on both sides, in m/s, and the volume rate of flow, in  $\text{m}^3/\text{s}$ .

**Problem 3** (10 pts + 5 pts extra credit)

The container shown in the figure is filled with mercury (Hg), of density  $13.6\text{g/cm}^3=13,600\text{kg/m}^3$ , and there is a weightless piston resting on its surface that can move freely, that has on top of it two weights of mass 50kg each. The container has cross-sectional area  $100\text{cm}^2$ . The inverted glass tube has its open end inside the container, and is filled with Hg up to height  $h$  above the surface of Hg in the container. On the top part of the glass tube there is vacuum. The cross section of the glass tube is  $1\text{cm}^2$ . Atmospheric pressure is  $P_0=1\text{atm}=1.013\times 10^5\text{N/m}^2$ .

(a) What is the height  $h$  of the column of Hg in the glass tube, in cm? Hint: it is not 76cm.

Suppose now one of the 50kg weights is removed, the other one remains:

- (b) What is the new height of the Hg column, in cm?
- (c) By how much (in cm) did the piston move up when the 50kg weight was removed?
- (d) What is the work (in Joules) that was done to move the piston up when the weight was removed?
- (e) Explain where the energy to do the work calculated in (d) came from. Make a semiquantitative estimate of the energies involved to verify that your explanation makes sense.
